

Colouring page bell animalcule

Vorticella similis resembles a bell, hence the name bell animalcule. Under water, this microbe attaches itself to the leaves and roots of aquatic plants with its stem. And sometimes even crustaceans, in places where claws or feet cannot reach. He filters the water with its cilia in search of food. If it's disturbed or in danger, the bell animalcule retracts its stem very quickly.

Take care of each other, see you soon
