

Colouring page eye animalcule

Euglena gracilis is an eye animalcule and lives in ditches. This single-celled microbe looks a bit like plants and animals. He makes sugars with the help of sunlight, just like plants. But he also eats other microbes, just like animals. His name comes from his red 'eye' spot. This allows the eye animalcule to determine the direction of the sunlight, telling him which way to swim.

Take care of each other, see you soon
